New high growth methanotrophic bacterial strain, useful for producing single cell proteins, grows on a Cl carbon substrate, and comprises a functional gene encoding in Embden-Meyerhof carbon pathway 157pp; English

The invention relates to a high growth methanotrophic bacterial strain, comprises a functional Embden-Meyerhof carbon flux pathway comprising a comprises a functional Embden-Meyerhof carbon flux pathway comprising a comprise a pyrophosphate dependent phosphofrutokinase enzyme or a 16s compression and for the biotransformation of a nitrogen-containing compound, compound, nitrate, nitrite or nitrogen. It is also useful for the production of a feed product comprising a protein, carbohydrates and a compression of a protein, carbohydrates and a compression of a feed product comprising a protein, carbohydrates and a compression of a containing environments such as landfills, waste water treatment systems or anywhere that methane, oxygen and nitrates are containing environments such as landfills, waste water treatment systems or anywhere that methane, oxygen and nitrates are containing environments such as landfills, waste water treatment systems or anywhere that methane, oxygen and nitrates are containing environments such as landfills, waste the present. The bacterial strain of the invention can be used as a containing compound of a protein can be used as a containing environment of the containing environment of nitrate or nitrite to nitrous condex with methane or methanol as a carbon source. It is also used in the containing environment in the containing environment in the protein of the protein o

encoding an enzyme in the carotenoid biosynthetic pathway, under the control of regulatory sequences, and contacting the host cell with carbon substrate to produce a carotenoid compound. The method is useful for producing carotenoid compounds such as antheraxanthin and astaxanthin, by using microorganism having a nucleic acid molecule encoding enzymes in the carotenoid biosynthetic pathway and which metabolise single carbon substrates. The carotenoids have potent anti-oxidant properties useful in diet, and aquaculture elements. The carotenoids are also useful as intermediates in the synthesis of steroids flavours and fragrances and intermediates in the synthesis of steroids flavours and fragrances and compounds for potential electro-optic applications. The present sequence is Methylomonas 16a sp. D-1-deoxyxylulose-5-phosphate synthase (Dxs) The invention relates to a method for producing carotenoid compounds. The method comprises a transformed metabolising host cell, comprising suitable levels of isopentenyl pyrophosphate and a nucleic acid molecule encoding an enzyme in the carotenoid biosynthetic pathway, under the used in the invention

                                                                                                      acid molecule encoding a isoprenoid biosynthetic Methylomonas 16a, useful for the production of is
                                                                                                      ic enzyme, isoprenoid
```

Claim 4; Page ; 89-99 84pp; English

an isopremoid biosynthetic enzyme isolated from Methylomonas 16a. The invention is useful for obtaining a nucleic acid molecule encoding an isopremoid compound biosynthetic enzyme, and for the microbial production of isopremoid compounds. The molecules of the invention are also useful for regulating isopremoid biosynthesis in an organism and for producing recombinant organisms for producing various isopremoid compounds. The mucleic acid is also useful for feed additive, for the production of keratemoids and their derivatives, isopremoid intermediates, and as pure products useful as pigments, flavours and fragrances. The present amino acid sequence represents the Methylomonas 16a open reading frame 1 (ORF1) dxs (1-deoxyxylulose-5-phosphate synthas enzyme) protein of the invention, as described above. The present invention relates to a new nucleic acid molecule encoding synthase

                                                                                                                                                                     CC in meed of enhanced or inhibited activity or expression of or cimmunological response to dxs. Dxs and the nucleic acid encoding it are useful as diagnostic reagents, especially in relation to diseases related CC to expression or activity of dxs. Fragments of the nucleic acid are CC useful as probes or primers and to synthesise full length dxs CC polynucleotides. The nucleic acid and protein are useful for diagnosing bacterial infections, especially by Pseudomonas aeruginosa, staging a CC disease or response of an infectious organism to drugs, and are also used in a structure based design of an (ant)agonist to dxs. The nucleic acid, CC protein and antibodies raised against it are useful for screening for the initial physical interaction between a pathogen and a mammalian host responsible for sequelae of infection. These molecules are useful in CC preventing adhesion of gram positive and/or gram negative bacteria to CC eukaryotic extracellular matrix proteins or in-dwelling devices or in CC opthogenesis in infections initiated other than by the implantation of CC in-dwelling devices or by other surgical techniques. Dxs is also useful CC in-dwelling devices or by other surgical techniques. Dxs is also useful CC are useful for treating Helicobacter pylori infection, and also to CC carefinoma.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                isoprenoids. More particularly the invention provides isolated nucleic acids, substantially pure polypeptides, host cells, and methods for producing various isoprenoid compounds. The polypeptides are useful for the production of isoprenoids, especially CoQ(10). Expressing the pure polypeptides, which has 1-deoxyxylulose-5-phosphate synthase (DXS) activity, is useful for increasing production of CoQ(10) in a cell having endogenous DDS activity. This sequence represents a protein relating to the isoprenoid

The sequence represents Pseudomonas aeruginosa deoxyxylulose-5-phosphate cynthase, dxs, temperature sensitive mutant, ts-80. (Ant) agonists of dxs care useful for treating an individual in need of enhanced or inhibited activity or expression of or immunological response to dxs. Dxs and the cucleic acid encoding it are useful as diagnostic reagents, especially in certain to diseases related to expression or activity of dxs. Pragments of the nucleic acid are useful as probes or primers and to synthesise control in the serious pacterial infections, especially by Pseudomonas control in the serious or acid and protein are useful for drugs, and are also used in a structure based design of an (ant) agonist to dxs. The nucleic acid, protein and antibodies raised against it are useful for screening for (ant) agonists of dxs or the nucleic acid and are useful in preventing adhesion of prampositive and or pathogen and a mammalian host responsible for sequelae of infection. These molecules are useful in preventing adhesion of gram positive and/or gram negative bacterial to eukaryotic extracellular matrix proteins or confidence or indevices or in wounds; to block bacterial adhesion; to block the normal progression of pathogenesis in infections initiated other than the implantation of in-dwelling devices or by other surgical confidence. Dxs is also useful for identifying membrane bound or soluble receptors. The (ant) agonists are useful for treating Helicobacter pylori infection, and also to prevent, inhibit or treat gastric ulcers, confidence of the dxs sequence given in AAU00012.

```
CC of the nucleic acid are useful as probes or primers and to synthesise CC full length das polynucleotides. The nucleic acid and protein are useful CC for diagnosing bacterial infections, especially by Pseudomonas CC aeruginosa, stagling a disease or response of an infectious organism to CC drugs, and are also used in a structure based design of an (ant) agonist to das, The nucleic acid, protein and antibodies raised against it are CC useful for screening for (ant) agonists of dax or the nucleic acid and are useful to interfere with the initial physical interaction between a CC pathogen and a mammalian host responsible for sequelae of infection. CC These molecules are useful in preventing adhesion of gram positive and/or CC gram negative bacteria to eukaryotic extracellular matrix proteins or in-dwelling devices or in wounds; to block bacterial adhesion; to block the normal progression of pathogenesis in infections initiated other than CC the implantation of in-dwelling devices or by other surgical CC infection, and also useful for identifying membrane bound or soluble receptors. The (ant) agonists are useful for treating Helicobacter pylori infection, and also to prevent, inhibit or treat gastric ulcers, CC gastritis and gastrointestinal carcinoma.

CC from the dxs sequence is not shown in the specification but is derived CC from the dxs sequence given in AAU00012.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The sequence represents Pseudomonas aeruginosa deoxyxylulose-5-phosphate synthase, dxs, temperature sensitive mutant (st-32. (Ant)agonists of dxs are useful for treating an individual in need of enhanced or inhibited activity or expression of or immunological response to dxs. Dxs and the nucleic acid encoding it are useful as diagnostic reagents, especially in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Example 2; Page - ; 41pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         뮹
The invention relates to antisense inhibitors of genes essential to prokaryotic cellular proliferation, their use in identifying the genes, their use in the discovery of novel antiblotics, the essential genes themselves and the encoded proteins. The prokaryotes used are Escherichia coli, Staphylococcus aureus, Salmonella typhi, Klebsiella pneumoniae, Pseudomonas aeruginosa and Enterococcus faccalis. The promotion is also useful for the identification of potential new targets for antibiotic development. The antisense nucleic acids can also be used to identify proteins used in proliferation, to express these proteins. The proteins can be used to scene nucleic acid sequence is also useful to screen compounds in rational drug discovery programmes. The antisense nucleic acid sequence is also useful to screen for homologous nucleic acids which are required for cell proliferation in a wide variety of organisms. The present sequence represents an cessential prokaryotic cellular proliferation protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       23-OCY-2000; 2

                                                                                                                                                                                                                                                                                                                                                                                                                                             CC compound comprising using at least 1 DNA e.g. encoding a farnesyl CC pyrolinic producing enzyme. The method of preparation of an isoprenoid CC pyrolinic producing enzyme. The method of preparation of an isoprenoid CC pyrolinic producing enzyme. The method of preparation of an isoprenoid CC pyrolinic producting enzyme. The method of preparation of an isoprenoid CC compound comprises using at least 1 DNA, a vector, cloned cells, their CC derived recombinant DNAs or transformed products in a culture system and CC exitating the isoprenoid accumulated in the medium. The DNA encodes at CC least 1 of the following; (a) a compound for activating or catalysing CC the production of 1-deoxy-D-xylulose-5-phosphate from pyruvic acid and CC glycerylaidehyde-3-phosphate; (b) an enzyme producing farnesyl pyrolinic CC acid; (c) a protein which elevates the efficiency of synthesis of CC isoprenoid compounds and comprises a 3 or 4 amino acid sequence CC gibstituted or an additional amino acid being inserted; (d) a protein which activates or catalyses the production of 2-C-methyl-D-crythreitol-CC 4-phosphate from 1-deoxy-D-xylulose-5-phosphate; or (e) a protein which activates a target compound or reaction and is a string end or hybrid of CC the DNA encoded in (a)-(e). Isoprenoid compounds are useful in drugs CC (e.g. for the treatment of heart diseases, osteoporosis and hemostatis, CC on the non-mevalonate pathway and can be used as antibacterials and CC on the non-mevalonate pathway and can be used as antibacterials and CC herbicides. The present sequence is used in the exemplification of CC the processont invention.

1-Deoxy-D-xylulose-5-phosphate synthase protein and modulators potentially useful as pesticides, antibacterial agents, herbic herbicides,

Claim رب ۰, Page 10; 21pp; German.

This invention describes a 1-deoxy-D-xylulose-5-phosphate synthase (DXS) protein or active fragment and a DXS modulator. The DXS modulator is a structural analogue of pyruvate, glyceraldehyde-3-phosphate (GA3P) or 1-deoxy-D-xylulose-5-phosphate (DXP). Compounds that inhibit DXS activity are potentially useful as pesticides, antibacterial agents or herbicides. Compounds that stimulate DXS activity are potentially useful as growth promoters or for increasing biosynthesis of DXP derivatives, especially isoprenoids such as carotenoids, chiorophyll, phytols, lutein, sterols, ubdquinone, rubber and taxanes.

Manipulating isoprenoid expression in cells or organisms and identifying modulators of the expression, for use in antibacterials herbicides and to produce transgenic plants with improved properties HOLLOWAY & BEDFORD 99GB-0001902 NEW COLLEGE. properties

and

expression in cells or organisms having a mevalorate independent isopentyl diphosphate (IPP) synthesising pathway. The method comprises altering the activity of 1-deoxy-D-xylulose-5-phosphate synthase (DXPS) or a functional equivalent, derivative, or bioprecursor of it. The isoprenoid activity or expression modulators are used as medicaments to treat bacterial diseases, and as herbicides. The method can be used to produce transgenic plants which have higher levels of isoprenoids, and which have health care benefits when consumed. The present sequence represents the DXPS protein from Escherichia coli, which is used in the exemplification of the present invention. The present invention describes a method for manipulating isoprenoid (DXPS) ť

                                                                                                                                                                                                                                                                                                                                                                                                                                                    This invention describes the novel use of a DNA sequence encoding 1-deoxy-D-xylulose-5-phosphate synthease (DNAS), and optionally p-hydroxyphenylpyruvate dioxygenase (HPPD) and/or geranylgeranyl-pyrophosphate oxidoreductase (GGPPOR), to produce a plant with increased tocopherol, vitamin K, chlorophyll and/or carotenoid content. Transgenic plants containing DOXS DNA coding sequences can be used for production of plant and bacterial DOXS which also have increased tocopherol, vitamin K, chlorophyll and/or carotenoid content. The test system can be used to identify inhibitors of DOXS. This sequence represents the Escherichia coli DOXS protein described in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    DOXS; 1-decxy-D-xylulose-5-phosphate synthase; HPPD; GGPPOR; plant; p-hydroxyphenylpyruvate dioxygenase; tocopherol; vitamin K; chlorophyll; geranylgeranyl-pyrophosphate oxidoreductase; carotenoid; transgenic; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   AAY51613 standard;
                                                                                                                                                                                                                                                                                                                                                                                                            Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         N-PSDB;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    NPI:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Reindl

c. prokaryotic cellular proliferation, their use in identifying the CC genes, their use in the discovery of novel antibiotics, the essential CC genes themselves and the encoded proteins. The prokaryotes used are CC Bscherichia coli, Staphylococcus aureus, Salmonella typhi, Klebsiella CC pneumoniae, Pseudomonas aeruginosa and Enterococcus faecalis. The CC invention is also useful for the identification of potential new targets for antibiotic development. The antisense mucleic acids can also be used to identify proteins used in proliferation, to express these proteins, CC and to obtain antibodies capable of binding to the expressed proteins. The proteins can be used to screen compounds in rational drug discovery programmes. The antisense nucleic acid sequence is also useful to screen for homologous nucleic acids which are required for cell proliferation in a wide variety of organisms. The present sequence represents an CCC essential prokaryotic cellular proliferation protein.

CC Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic CCC format directly from WIPO at

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to methods and materials for the production of isopremoids. More particularly the invention provides isolated nucleic acids, substantially pure polypeptides, host cells, and methods for producing various isopremoid compounds. The polypeptides are useful for the production of isopremoids, especially CoQ([0]). Expressing the pure polypeptides, which has 1-deoxyyylulose-5-phosphate synthase (DXS) activity or decaprenyl diphosphate synthase (DDS) activity, is useful for increasing production of CoQ([0]) in a cell having endogenous DDS activity. This sequence represents a protein relating to the isopremoid production of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Substantially pure polypeptides having e.g., 1-deoxyxylulose-5-phosphate synthase activity, production of isoprenoids, especially CoQ(10)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Disclosure;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Isoprenoid; CoQ(10); 1-deoxyxylulose-5-phosphate decaprenyl diphosphate synthase.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  AAO21860 standard; Protein; 620

                                                                                          The invention relates to methods and materials for the production of isoprenoids. More particularly the invention provides isolated nucleic acids, substantially pure polypeptides, host cells, and methods for producing various isoprenoid compounds. The polypeptides are useful for the production of isoprenoids, especially CoQ(10). Expressing the pure polypeptides, which has 1-deoxyxylulose-5-phosphate synthase (DXS) activity, is useful for increasing production of CoQ(10) in a cell having endogenous DDS activity. This sequence represents a protein relating to the isoprenoid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Substantially pure polypeptides having e.g., 1-deoxyxylulose-5-phosphate synthase activity, production of isoprenoids, especially CoQ(10)
                                                                      production of the

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

GENERAL INFORMATION:
GENERAL INFORMATION:
APPLICANT: Cao, Yongwei
APPLICANT: Hinkle, Gregory J.
APPLICANT: Slater, Steven C.
APPLICANT: Slater, Steven C.
APPLICANT: Goldman, Barry S.
APPLICANT: Chen, Xianfeng
TITLE OF INVENTION: EXPRESSION OF MICROBIAL PROTEINS IN PLANTS FOR PRODUCTION OF
FITLE OF INVENTION: PLANTS WITH IMPROVED PROPERTIES
FILE REFERENCE: 38-10 (5-2052)B
CURRENT APPLICATION NUMBER: US/10/369,493
CURRENT PILING DATE: 2003-02-28
PRIOR APPLICATION NUMBER: US 60/360,039
PRIOR FILING DATE: 2002-02-21
NUMBER OF SEQ ID NOS: 47374
SEQ ID NO 7428
LENGTH: 619
TYPE: PRT
ORGANISM: Burkholderia cepacia
